

Help your kiwifruit vine wounds heal rapidly following winter pruning

Garrison Rapid – defense you can trust

Garrison Rapid seals and protects pruning wounds by aiding the wound to callous and heal naturally, therefore preventing spores from penetrating the vine.

The new “rapid” formulation incorporates a robust elastic paint resistant to cracking, with proven fungicides to provide superb rapid drying wound protection.

How to optimise wound protection with Garrison Rapid

1 Prune and paint on the same day

Potentially harmful spores are constantly being released throughout the orchard, so protecting pruning wounds on a daily basis is a must.

2 Avoid pruning in wet or slow drying conditions

Wet conditions are an ideal environment for disease containing spores to release and take hold. These greatly increase the risk of wound infection. On days where rain showers are expected, apply Garrison Rapid to all pruning cuts at the completion of every tree or bay pruned, as opposed to the end of the day.

3 Apply Garrison Rapid liberally to fresh, clean wounds

>15mm in diameter using the applicator bottle or paint brush.

4 For larger trunk wounds

Special attention should be taken to ensure cuts are totally sealed. (>50mm in diameter) In some cases a second application may be beneficial.

5 Clean up

At the end of each day applicator brushes should be thoroughly cleaned in fresh water. 2L and 10L containers should be kept sealed between bottle top-ups to avoid a skin forming on top of the paint.

Two actives – twice the punch

Garrison Rapid contains 2.5g/l cyproconazole and 1.0g/l iodocarb in the form of a paint.

Available in 2L and 10L easy pour containers, both supplied with 500ml applicator bottles.

Our rapid formulation is rain fast in 4 hours under good drying conditions.
